

Social Media Use and Adolescent Sleep Quality: A Cross-Sectional Analysis

Authors

Garcia M, Thompson S. Public Health Department, West University.

Abstract

We examined associations between social media use duration and sleep quality among 150 adolescents aged 14–18. Sleep quality was measured with the Pittsburgh Sleep Quality Index (PSQI). Correlation between daily social media hours and PSQI score: $r = 0.42$ ($n=150$, $p < .001$). Findings suggest that higher social media use is associated with poorer sleep quality.

Methods

Cross-sectional survey. $N=150$ high school students. Measures: self-reported daily social media hours; PSQI total score. Analysis: Pearson correlation.

Results

Mean social media use: $M=3.8$ hours/day ($SD=1.4$). Mean PSQI: $M=7.2$ ($SD=2.1$). Pearson $r = 0.42$, $n=150$, $p < .001$.
