

# Attitudes Toward Remote Work in Small Organisations: A Survey Study

## Authors

Brown K, Wilson T. School of Business, Northern College.

## Abstract

We surveyed 11 employees in small organisations about their attitudes toward remote work using a 5-point Likert scale (1=strongly disagree, 5=strongly agree). Mean attitude score was  $M=3.7$  ( $SD=0.9$ ,  $n=11$ ). Participants who had prior remote experience scored higher ( $M=4.2$ ,  $SD=0.8$ ,  $n=7$ ) than those without ( $M=2.9$ ,  $SD=0.6$ ,  $n=4$ ). A t-test showed  $t(9) = 2.81$ ,  $p = .021$ .

## Methods

Survey instrument: 1-item scale (integer responses 1–5). Sample:  $n=11$  convenience sample from two small firms. Analysis: independent samples t-test. The mean score of 3.7 on an integer scale with  $n=11$  reflects overall positive attitudes.

## Results

Overall attitude:  $M=3.7$ ,  $SD=0.9$ ,  $n=11$ . Prior remote experience group:  $M=4.2$ ,  $SD=0.8$ ,  $n=7$ . No prior experience group:  $M=2.9$ ,  $SD=0.6$ ,  $n=4$ .  $t(9) = 2.81$ ,  $p = .021$ . Note: all responses were whole-number integers on the 5-point scale.
